

VENTANITA

WHATSAPP ORDER AUTOMATION

PRODUCT OVERVIEW
v3 — SEPTEMBER 2026
AUTISMLLM

Ventanita answers your phone the way a good counter person would — **in your own voice**, on the WhatsApp number your customers already have saved, running on a computer you own instead of a platform that bills you per conversation.

01 Watches Reads the chat list the way a person glancing at their phone would — text, photo, or voice note.	02 Understands Order, question, or complaint — placed in the context of who's asking and what they usually get.	03 Answers Typed or spoken, in the stand's own voice, at the pace of someone actually mid-shift.	04 Charges Sends a Mercado Pago link for the order total and keeps the ticket open until it clears.	05 Confirms The moment the payment lands, the right customer — by name, not by luck — hears the order is on.
---	---	--	---	--

FRONT OF HOUSE

What the customer experiences

● One number, always on	No app to download, no bot menu to navigate, no "reply 1 for pastor, 2 for suadero." Customers text the stand exactly like they'd text a friend, and get answered in Mexican Spanish — chilango slang, not customer-service copy.
● Remembers regulars	Every conversation adds to a running note on that customer — what they order, how they like it, whether they always ask for extra salsa. The note travels with them across visits without replaying the whole chat history every time.
● Hears, sees, and talks back	A voice note saying "dos de pastor, uno sin cebolla" or a photo of a handwritten office lunch list works the same as typed text — and a reply can be spoken back, useful mid-rush and for regulars who'd rather listen than read.
● Pays without leaving the chat	A Mercado Pago link lands in the same thread as the order. Card, transfer, or wallet — whatever the customer already has set up.

BACK OF HOUSE

What's actually running

● Handles a rush, not one line at a time	When four tables text at once, Ventanita works through all of them in one pass — oldest unanswered first — instead of freezing on whichever chat happened to be on top of the screen.
● Waits for you to finish typing	If a customer is still composing, Ventanita holds its answer — the same courtesy a person would extend — rather than replying to half a thought.
● Knows the order's real status	Every ticket moves through a real lifecycle — new → preparing → ready → paid — with cancellations tracked as their own outcome, not lost as a typo in a free-text field.
● Tracks how people actually pay	Cash, transfer, card, or Mercado Pago — recorded per order, alongside each customer's preferred method, so the second link is never a guess.
● Picks its model, not the other way around	A model running entirely on the operator's own machine when the order matters more than the polish, or a rented cloud model paid per message when it doesn't — the same stand can switch without touching how it talks to customers.

GUARDRAILS

What it won't do on its own

KILL SWITCH	One key stops every reply mid-type, instantly.	ACTIVE HOURS	Sleeps outside the hours the stand actually answers a phone.
SPEND THRESHOLD	Orders above a set amount wait for a human before anything is charged.	FAIL LOUD	An unclear order gets one clarifying question — never a guess.

UNDER THE HOOD

Built to be understood by one person

Every "AI customer engagement platform" charging \$500 a month is running the same idea Ventanita is: read a message, decide what it means, write back. The difference is what's between those two lines. Ventanita keeps it small enough that the person running the stand can still open the file and understand every step — no orchestration layer, no message queue, no vendor to call when it breaks at 9pm on a Friday.

RUNTIME	One process, on the operator's own computer — no cloud account required to keep taking orders.
MEMORY	A single SQLite file. Customers, orders, and conversation history — open it with any database viewer, no server involved.
LANGUAGE MODEL	Swappable behind one seam — a hosted model billed per message, or a local model with no per-message cost at all.
PAYMENTS	Mercado Pago Checkout — a link per order, confirmation matched back to the customer who placed it.
VOICE & VISION	Voice notes transcribed, photos read, replies optionally spoken back.
OWNERSHIP	Every record — every order, every conversation — lives on hardware the operator owns.

WHY IT EXISTS

The toll booth was never necessary

A cook can't type and flip tortillas at the same time. That's the whole problem the billion-dollar "conversational commerce" industry charges per message to solve. Ventanita solves it once, on hardware the stand already owns, in a voice that sounds like the stand — not a template Meta pre-approved.
